

OKO MEDICAL EYECARE

Myopia Control Center

Schedule Consultation

"We thought my child just needed stronger glasses... No one told us the eye itself was getting longer."
– Parent of patient

Myopia isn't just blurry vision. As the eye elongates, long-term risks rise — including retinal detachment, early macular degeneration, cataracts, and glaucoma.

Myopia control slows this progression, protecting your child's vision now and into adulthood.

Children who squint, struggle to see the board, or avoid outdoor activities often aren't just dealing with blurry vision — their eyes may be growing too quickly.

At OKO Medical Eyecare, we use evidence-based treatments to slow down abnormal eye growth, helping kids see clearly, learn comfortably, and prevent long-term retinal damage

Myopia control empowers children to:

- See the board without straining
- Avoid the "stronger glasses every year" cycle
- Protect their future eye health

WHAT IS MYOPIA CONTROL?

Myopia control is a proven approach to slow or stop the progression of nearsightedness.

Unlike regular glasses — which only correct vision — myopia management actually helps protect the eye from worsening.

Schedule Consultation

Eye Drops

Nightly drops relax the eye's focusing system and have been shown to significantly slow progression.

Stellete Glasses

Myopia control glasses that reduce eye elongation and give clear distance vision

Soft Contact Lenses

Specialized optics reduce eye elongation and give clear distance vision.

Ortho-K

Nighttime lenses reshape the cornea, giving your child clear daytime vision with some of the most effective long-term control results.
